

Date: 22 January 2009

Affected Products: I-2000 Emergency Warning and Intercommunication System

Revision 2 of the I-2000 configuration sheet has been released to make the following changes;

1. Change to default evacuation voice message

To help improve the quality of the pre-recorded evacuation voice message of the I-2000 EWIS, Notifier is changing the default setup of the product. The default evacuation sequence will now be T3 pattern...“Emergency”...T3 pattern again...“Evacuate Now”.

To facilitate this setup all EMUX (custom) recorded messages will be disabled in the configuration and on the EMUX itself. To re-enable custom recorded messages on-site a new configuration needs to be loaded and the EMUX setup correctly (as per manual).

2. Option to only play voice messages in “Auto” position

This option has been added to allow customers to select only to play the pre-recorded voice message in the “Auto” position.

If you have any question please do not hesitate to contact me.

Sincerely,

James Edwards
